Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 20 30 40 50
Output: 10 20 30 40 50

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

// Define the Node structure
typedef struct Node {
    int data;
    struct Node* prev;
    struct Node* next;
} Node;

Node* head = NULL;
Node* tail = NULL;

// Function to insert at the end of the list
void insertAtEnd(int data) {
    Node* new_node = (Node*)malloc(sizeof(Node));
    new_node->data = data;
    new_node->prev = NULL;
    new_node->next = NULL;

    if (head == NULL) {
        head = tail = new_node;
    } else {
```

```
        tail->next = new_node;
        new_node->prev = tail;
        tail = new_node;
    }
}

// Function to display the list
void display() {
    Node* temp = head;
    while (temp != NULL) {
        printf("%d ", temp->data);
        temp = temp->next;
    }
    printf("\n");
}

// Main function
int main() {
    int N, value;
    scanf("%d", &N);

    for (int i = 0; i < N; i++) {
        scanf("%d", &value);
        insertAtEnd(value);
    }

    display();

    return 0;
}
```

Status : Correct **Marks : 10/10**
